

# CAPRI 4.1

## New Features & Changes

Enhancements and changes made to the CAPRI software from version 4.05 to version 4.1 include the following:

- **Removal of FHWA references** – References to FHWA were removed from several screens within the software, as well as the Part A Report header. However, FHWA was not removed from recommendations or violations. The recommendations should be modified locally. Violation descriptions which refer to FHWA will be modified when FHWA is removed from the associated regulation.
- **SAFETYNET 2000 compatibility** – CAPRI will now import assignment files from and export completed reviews to SAFETYNET 2000. These new features were added while retaining the flexibility to import from and export to SAFETYNET 10.

**Import** – To import assignments, select the File | Import menu option for either Subject Data From SAFETYNET 10 or Subject Data From SAFETYNET 2000, as appropriate. Additionally, a new menu item has been added to File | Import for integrating the Locally Defined Fields configuration file, generated by SAFETYNET 2000.

**Export** – To export completed reviews, select the menu option for File | Export | Completed Reviews To SAFETYNET. **If the destination is SAFETYNET 10**, be sure the checkbox labeled SAFETYNET 2000 is NOT marked. **If the destination is SAFETYNET 2000**, be sure the checkbox labeled SAFETYNET 2000 IS marked.

- **Resizing** – The CAPRI application has been enlarged. The resizing may be turned on/off by the user through the use of a new resizing menu option under "System | Preferences". It is still HIGHLY recommended that the Windows font be set to small. If it is necessary to increase font sizes for all Windows applications, try setting them via the Display Properties tab labeled Appearance. The Technical Support Hotline can assist in this matter.
- **CTFR Reports** – The Cargo Tank Facility Review reports have been replaced with new versions designed by members of the Cargo Tank TAG.
- **Part A** – The address tab check box for "Same as Physical" was changed to a button labeled "Copy Physical Address". Mailing address is no longer disabled when the physical address is copied into it.
- **Part A Report** – The Part A report will no longer include an FHWA Region and the Shipper Only Part A Report no longer includes the grid for equipment and drivers.

- **Part B** – Additional CFR Parts are now accepted by CAPRI.
- **Part B Acute/Critical Violation Cites** – The violation cites designated as acute or critical have been updated. One new critical cite has been added for 180.407(c). This updated list matches the revision to Part 385 expected to be published in January, 2000. Any existing policy regarding the implementation of acute/critical cites will continue to be in effect until such time as the revision to Part 385 is published.
- **Rating** – A new feature, located under the menu option "System | Preferences", provides the ability to enable/disable the rating of Intrastate HM and/or Intrastate non-HM separately.
- **Edit Checks** – A new edit check will warn users prior to printing the Part C Report if the minimum Parts required for a rating are not marked as reviewed.
- **Edit Checks** – A new alert message will be displayed after printing Part B for a carrier with an unsatisfactory rating which states the review must be uploaded within seven days.
- **Edits Checks** – Additional range checking is now performed for all date fields. This will prohibit future dates except in the case of expiration dates. Range checks have also been added to many numeric fields.
- **Edit Checks** – If the Warn on Exit feature is set to active under System | Preferences, clicking the "x" in the upper right corner of CAPRI will provide a warning before the software shuts down.
- **Two Digit Years** – CAPRI 4.1 will default two digit years of 50 or more to 1900, while 49 or less will default to 2000. The exception is driver's date of birth where 20 or higher defaults to 1900 and 19 or below defaults to 2000.
- **Hours of Service Worksheet** – The driver's name was added to the Hours of Service Violation List Report. This report is available via the "Print List" button located along the bottom of the screen.
- **Recommendations** – A new feature has been added under the System menu option called Standard Recommendations Add/Edit/Delete. This module is used to modify the list of recommendations without having to be in a review.
- **CDLIS** – The default transaction type for driver names sent to CDLIS from within CAPRI may now be set by the user. The configuration setting is located on the CDLIS Configuration screen accessed via the menu option System | Preferences | CDLIS Configuration.
- **List Missing Data** – The feature for listing missing data in Parts A, C and CTFR may now sort the listed items by clicking on the column headers.

- **Path Browser** – The Path Browser, used to select the path when importing, exporting, backing up, or restoring now provides the ability to create a new directory.
- **Error.txt file** – If the CAPRI software crashes, it will write information about the failure to a file called "Error.txt". This will allow the Technical Support Hotline to better troubleshoot errors.
- **DOS Accident Countermeasures (ACM)** - Although the software has been phased out by the FMCSA, the DOS ACM program was updated to handle the year 2000.
- **Sampling** – The sampling charts have been removed from CAPRI temporarily until the new Compliance Review chapter of the Training Manual is released.
